

Zagreb, 14 June 2017

Announcement of the application of the countercyclical buffer rate for the Republic of Croatia for the third quarter of 2018

In accordance with Article 123 of the Credit Institutions Act (Official Gazette 159/2013, 19/2015 and 102/2015), the Croatian National Bank (CNB) hereby announces that the Decision on the countercyclical buffer rate (Official Gazette 9/15), which prescribes the countercyclical buffer rate of 0%, will continue to be applied in the third quarter of 2018.

The Decision on the countercyclical buffer rate (Official Gazette 9/2015) provides an instrument to be used, if necessary, to limit excessive credit growth; it is a variable capital requirement that depends on the cyclical component of the private sector relative credit gap (i.e. the ratio of loans to households and non-financial enterprises to gross domestic product)¹. The Decision sets the countercyclical buffer rate at 0%, to be applied as of 1 January 2016. On the basis of a recent analytical assessment of the evolution of systemic risks, the CNB hereby announces that it shall maintain the same rate of 0%, which shall be applied in the third quarter of 2018, i.e. as of 1 July 2018. In accordance with Articles 119, 123 and 380 of the Credit Institutions Act, the following relevant information is disclosed:

Real GDP grew at the annual rate of 2.5% in this year's first quarter, primarily as a result of the rise in the exports of goods. Household consumption continued to register stable growth and the growth of investment activity was relatively strong as well, while government spending increased slightly from the end of 2016. The imports of goods and services intensified noticeably as well, which ultimately rendered the contribution of foreign demand negative again, in net terms. Positive labour market developments from the past year continued, the employment increasing in all activities. Positive macroeconomic signals continued to mildly stimulate credit demand so bank lending to the non-financial sector (measured by transactions) increased again in the first quarter 2017. On an annual level, however, this growth slowed down. As for households, the growth of placements continued to gain strength on an annual basis, especially the growth of loans in the domestic currency. On the other hand, the nominal decrease of the debt to banks continued in the beginning of 2017 as well, aided by the write-off of a portion of household loans indexed to the Swiss franc, by the sale of bad placements and the strengthening of the kuna against the euro.

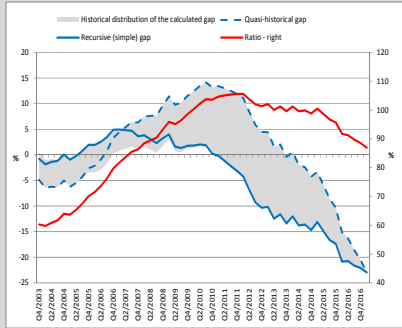

¹ See Box 4 for detailed methodological explanations: Financial cycle and countercyclical capital buffer calibration, Financial Stability, No. 13, July 2014.

The growth of gross domestic product and the reduction in the debt of non-financial enterprises and households resulted in a further reduction in the standardised credit-to-GDP ratio which in the first quarter of 2017 additionally decreased to 86.9%, while the credit gap, calculated on the basis of the standardised ratio continued to be negative (-23%). Although credit activity recovered slightly (measured by transactions), there is no potential cyclical pressure build-up requiring corrective action from the CNB via the increase in the countercyclical buffer rate. This is also confirmed by the specific indicators of relative indebtedness based on the narrow definition of credit, which comprises only claims of domestic credit institutions, placed in relation to the quarterly, seasonally adjusted, GDP (Figures 1 and 2).

Figure 2 Buffer guide

1.a Standardised indicator

1.b Specific indicator

^a Calculations of all relevant ratios and the short-term gap are made on a sample as of 2000. The quasi-historical gap is calculated on the entire sample and the recursive gap is calculated on the right-hand side moving sample (of available data for each quarter), with the last observations being always the same for both gap indicators. Historical series of buffer guides are shown as the function of the short-term (recursive) gap.

Sources: CBS (original series of nominal GDP, seasonally adjusted by the CNB); CNB (tables D1, D5 and H15 for time series of credit); time series are subject to revision and available at the CNB website.

In line with its macroprudential policy and ESRB recommendations², the CNB will regularly monitor the evaluation of potential imbalances in financing private sector needs and announce buffer guides and countercyclical buffer rates on a quarterly basis. With reference to this, the CNB will also rely on all other relevant information and indicators that may point to risks of excessive credit growth, such as price developments in the goods and services markets, the current account deficit, the dynamics of placements and monetary aggregates, etc., which are available at the following website:
